

Visualise your Production Plan with Cim200's Graphical Scheduler

Integrated with Cim200 Manufacturing, control your shopfloor workload with our intuitive and easy to use interface.

Utilise Your Resources

Group your resources and schedule production based on the capacity and availability of labour resources, machine resources or both.

Easily Control Your Production

Quickly see shopfloor workload and take control of your production plan to improve your manufacturing efficiency.

Prevent Resource Conflicts

Predict and resolve future resource conflicts and overloads to optimise the production plan to meet customer demands.

Key Scheduler Functionality

Feature

Description

Conflict Management

Resolve machine and labour conflicts in real time by dragging and dropping affected operations to alternative times or resources.

Resource Utilisation

Review colour-coded utilisation of resources by percentage to get an understanding of overloads for labour and machine resources, factory load imbalances and where they occur.

Works Order Planning

Resolve issues with works orders and operations to meet planning deadlines, before passing back the changes to Cim200 which updates the works orders.

Dynamic Colour Coding

Colour coding is employed to highlight: late works orders, at-risk works orders, resource conflicts and resource overloads.

Dependency Management

Operation dependency links operations from the same works order together. So, if an operation is moved to a future date, any operations beyond this date will be automatically rescheduled.
